Question 1

Correct

Mark 1.00 out of 1.00

Flag question

Problem Description:

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

For example:

Input	Result
16	The square root of 16.0 is 4.00
-4	Error: Cannot calculate the square root of a negative number.
rec	Error: could not convert string to float

Answer: (penalty regime: 0 %)

```
1 try:
2     num=float(input())
3     if(num<0):
4         print("Error: Cannot calculate the square root of a negative number.")
5     else:
6         print("The square root of",num,"is", "%.2f"%(num**0.5))
7 except:
8     print("Error: could not convert string to float")
```
